- c. wherein at least a portion of the drive mechanism rotates on a third axis at a first angle with respect to the first axis and a second angle with respect to the second axis.
- 2. (original) The surgical tool of claim 1, wherein the first and second angles are substantially equal.
- 3. (original) The surgical tool of claim 2, wherein the first and second axes are substantially parallel.
- 4. (original) The surgical tool of claim 1, wherein the cup comprises an acetabular reamer.
- 5. (original) The surgical tool of claim 1, further comprising a plurality of interlocking links extending through the conduit.
- 6. (original) The surgical tool of claim 1, wherein each of the links includes a male end and a female end.
- 7. (original) The surgical tool of claim 6, wherein the male end includes a plurality of exterior facets and the female end includes a plurality of interior facets.
- 8. (original) The surgical tool of claim 7, wherein the exterior facets define a hexagon.
- 9. (original) The surgical tool of claim 7, wherein each link rotates along a link axis, and wherein the male end has a radius of curvature in a plane parallel to the rotational axis.

- 10. (original) The surgical tool of claim 9, wherein the female end has a second radius of curvature in the plane.
- 11. (original) The surgical tool of claim 6, further comprising a bushing disposed within the female end of a first of the links and the male end of a second of the links.
- 12. (original) The surgical tool of claim 11, wherein the bearing is spherical.
- 13. (original) The surgical tool of claim 1, wherein the acetabular cup is comprises a reamer surface.
- 14. (original) The surgical tool of claim 1, wherein the head comprises a cup support receiving an acetabular cup.
- 15. (original) A surgical tool for positioning a jointreplacement cup, the joint-replacement cup including a threaded hole, the surgical tool comprising:
 - a. a conduit having a head end and a drive end;
 - a drive mechanism rotatably attached to the drive end of the conduit, the drive mechanism rotating on a first axis; and
 - c. a head connected to the head end of the conduit, the head including:
 - i. a cup attachment supporting the cup; and
 - ii. a threaded attachment actuator having an attach state and a release state, the attach state securing the cup attachment to the cup and the release state releasing the cup;

- iii. wherein the actuator support transitions between the attach and release states without rotating with respect to the conduit.
- 16. (original) The surgical tool of claim 15, wherein the attachment actuator includes first and second jaws extending into the hole.
- 17. (original) The surgical tool of claim 16, wherein the attachment actuator further includes a wedge extending between the first and second jaws, and wherein the attach state corresponds to a first wedge position and the release state corresponds to a second wedge position.
- 18. (original) The surgical tool of claim 17, wherein the hole comprises female threads, and wherein the first and second jaws include partial threads.
- 19. (original) The surgical tool of claim 18, wherein the partial threads engage the female threads in the first wedge position and disengage the female threads in the second wedge position.
- 20. (original) The surgical tool of claim 15, wherein the conduit includes at least one bend between the head end and the drive end.
- 21. (original) The surgical tool of claim 15, further comprising a plurality of interlocking links extending through the conduit.

PATENT

- 22. (original) The surgical tool of claim 15, wherein each of the links includes a male end and a female end.
- 23. (original) The surgical tool of claim 22, wherein the male end includes a plurality of exterior facets and the female end includes a plurality of interior facets.
- 24. (original) The surgical tool of claim 23, wherein the exterior facets define a hexagon.
- 25. (original) The surgical tool of claim 23, wherein each link rotates along a link axis, and wherein the male end has a radius of curvature in a plane parallel to the rotational axis.
- 26. (original) The surgical tool of claim 25, wherein the female end of each link has a second radius of curvature in the plane.
- 27. (original) The surgical tool of claim 26, further comprising a bearing disposed within the female end of a first of the links and the male end of a second of the links.
